Obsessive-Compulsive Disorder (OCD)

Are obsessive thoughts and compulsive behaviors interfering with your daily life? Explore the symptoms, treatment, and self-help for OCD.

What is obsessive-compulsive disorder (OCD)?

It’s normal, on occasion, to go back and double-check that the iron is unplugged or worry that you might be contaminated by germs, or even have an occasional unpleasant, violent thought. But if you suffer from obsessive-compulsive disorder (OCD), obsessive thoughts and compulsive behaviors become so consuming they interfere with your daily life. OCD is an anxiety disorder characterized by uncontrollable, unwanted thoughts and ritualized,
repetitive behaviors you feel compelled to perform. If you have OCD, you probably recognize that your obsessive thoughts and compulsive behaviors are irrational—but even so, you feel unable to resist them and break free.

Like a needle getting stuck on an old record, OCD causes the brain to get stuck on a particular thought or urge. For example, you may check the stove 20 times to make sure it’s really turned off because you’re terrified of burning down your house, or wash your hands until they’re scrubbed raw for fear of germs. While you don’t derive any sense of pleasure from performing these repetitive behaviors, they may offer some passing relief for the anxiety generated by the obsessive thoughts.

You may try to avoid situations that trigger or worsen your symptoms or self-medicate with alcohol or drugs. But while it can seem like there’s no escaping your obsessions and compulsions, there are plenty of things you can do to break free of unwanted thoughts and irrational urges and regain control of your thoughts and actions.

**OCD obsessions and compulsions**

Obsessions are involuntary thoughts, images, or impulses that occur over and over again in your mind. You don’t want to have these ideas, but you can’t stop them. Unfortunately, these obsessive thoughts are often disturbing and distracting.

Compulsions are behaviors or rituals that you feel driven to act out again and again. Usually, compulsions are performed in an attempt to make obsessions go away. For example, if you’re afraid of contamination, you might develop elaborate cleaning rituals. However, the relief never lasts. In fact, the obsessive thoughts usually come back stronger. And the compulsive rituals and behaviors often end up causing anxiety themselves as they become more demanding and time-consuming. This is the vicious cycle of OCD.
Most people with OCD fall into one of the following categories:

- **Washers** are afraid of contamination. They usually have cleaning or hand-washing compulsions.
- **Checkers** repeatedly check things (oven turned off, door locked, etc.) that they associate with harm or danger.
- **Doubters and sinners** are afraid that if everything isn’t perfect or done just right something terrible will happen, or they will be punished.
- **Counters and arrangers** are obsessed with order and symmetry. They may have superstitions about certain numbers, colors, or arrangements.
- **Hoarders** fear that something bad will happen if they throw anything away. They compulsively hoard things that they don’t need or use. They may also suffer from other disorders, such as depression, PTSD, compulsive buying, kleptomania, ADHD, skin picking, or tic disorders.
Is it OCD-related hoarding or Hoarding Disorder?

While hoarding is associated with the compulsions of OCD, it can also be a sign of a separate condition, Hoarding Disorder. The main distinction is that as a symptom of OCD, hoarding is usually unwelcome and very distressing—a way to manage intrusive thoughts. As an OCD-hoarder, you derive no pleasure from your saved possessions and you’re more likely to accumulate useless or unusual items without any monetary or sentimental value—old newspapers, rotten food, or broken objects, for example.

In Hoarding Disorder, acquiring possessions provides pleasure rather than simply satisfying a compulsion. The items you accrue are also more likely to have some intrinsic or emotional value, at least to you. Often, you’ll hold on to items in the belief that they’ll be useful sometime in the future. The distress in Hoarding Disorder stems more from the consequences of your hoarding—the clutter and unsafe environment—along with the anxiety of having to discard possessions.

OCD signs and symptoms

Just because you have obsessive thoughts or perform compulsive behaviors does NOT mean that you have obsessive-compulsive disorder. With OCD, these thoughts and behaviors cause tremendous distress, take up a lot of time (at least one hour per day), and interfere with your daily life and relationships.

Most people with obsessive-compulsive disorder have both obsessions and compulsions, but some people experience just one or the other.

Common obsessive thoughts in OCD include:

- Fear of being contaminated by germs or dirt or contaminating others
- Fear of losing control and harming yourself or others
- Intrusive sexually explicit or violent thoughts and images
- Excessive focus on religious or moral ideas
- Fear of losing or not having things you might need
- Order and symmetry: the idea that everything must line up “just right”
- Superstitions; excessive attention to something considered lucky or unlucky

Common compulsive behaviors in OCD include:
• Excessive double-checking of things, such as locks, appliances, and switches
• Repeatedly checking in on loved ones to make sure they’re safe
• Counting, tapping, repeating certain words, or doing other senseless things to reduce anxiety
• Spending a lot of time washing or cleaning
• Ordering or arranging things “just so”
• Praying excessively or engaging in rituals triggered by religious fear
• Accumulating “junk” such as old newspapers or empty food containers

**OCD symptoms in children**

While the onset of obsessive-compulsive disorder usually occurs during adolescence or young adulthood, younger children sometimes have symptoms that look like OCD. However, the symptoms of other disorders, such as ADHD, autism, and Tourette’s syndrome, can also look like obsessive-compulsive disorder, so a thorough medical and psychological exam is essential before any diagnosis is made.

**OCD self-help tip 1: Identify your triggers**

The first step to managing your OCD symptoms is to recognize the triggers—the thoughts or situations—that bring on your obsessions and compulsions. Record a list of the triggers you experience each day and the obsessions they provoke. Rate the intensity of the fear or anxiety you experienced in each situation and then the compulsions or mental strategies you used to ease your anxiety. For example, if you have a fear of being contaminated by germs, touching a railing at the mall might generate a fear intensity of 3, whereas touching the restroom floor in the mall might generate a 10 and require 15 minutes of hand washing to ease your anxiety.

Keeping track of your triggers can help you anticipate your urges. And by anticipating your compulsive urges before they arise, you can help to ease them. For example, if your compulsive behavior involves checking that doors are locked, windows closed, or appliances turned off, try to lock the door or turn off the appliance with extra attention the first time.

• Create a solid mental picture and then make a mental note. Tell yourself, “The window is now closed,” or “I can see that the oven is turned off.”
• When the urge to check arises later, you will find it easier to re-label it as “just an obsessive thought.”
Identifying and recording your triggers also provides an important tool for learning to resist your OCD compulsions.

**Tip 2: Learn to resist OCD compulsions**

It might seem smart to avoid the situations that trigger your obsessive thoughts, but the more you avoid them, the scarier they feel. Conversely, by repeatedly exposing yourself to your OCD triggers, you can learn to resist the urge to complete your compulsive rituals. This is known as **exposure and response prevention (ERP)** and is a mainstay of professional therapy for OCD.

ERP requires you to repeatedly expose yourself to the source of your obsession—and then refrain from the compulsive behavior you’d usually perform to reduce your anxiety. If you are a compulsive hand washer, for example, that could mean touching the door handle in a public restroom and then not allowing yourself to wash your hands. As you sit with the anxiety, the urge to wash your hands will gradually begin to go away on its own. In this way, you’ll learn that you don’t need the ritual to get rid of your anxiety and that you have some control over your obsessive thoughts and compulsive behaviors.

Tackling your biggest fears straight off might be too extreme, so ERP exercises start with you confronting lesser fears and then working your way up the “fear ladder.” Confront those situations that generate a low fear intensity and once you’re able to tolerate the anxiety you can move on to the next, more difficult exposure challenge.

**Building your fear ladder**

Think about your end goal (to be able to use a public restroom without fear of contamination, for example, or to drive to work without stopping to check if you’ve hit something) and then break down the steps needed to reach that goal. Using the information you recorded in identifying your triggers, make a list of situations from the least scary to the most scary. The first step should make you slightly anxious, but not so frightened that you’re too intimidated to try it.

Here’s a sample fear ladder:

| Goal: To drive to work without stopping to check if you’ve hit something |
|---------------------------------------------------------------|------------------|
| Fear intensity | Situation |
Goal: To drive to work without stopping to check if you’ve hit something

10. Drive all the way to work without stopping to check if you’ve hit something

8. Don’t phone your spouse to check they got to work safely

6. Leave the house, lock the front door and walk away without checking

4. Turn off the stove and leave the room without checking

2. Put milk in the refrigerator without checking the top is secure

Using your fear ladder

Work your way up the ladder. Start with the first step and don’t move on until you start to feel more comfortable doing it. If possible, stay in the situation long enough for your anxiety to decrease. The longer you expose yourself to your OCD trigger, the more you’ll get used to it and the less anxious you’ll feel when you face it the next time. Once you’ve done a step on several separate occasions without feeling too much anxiety, you can move on to the next step. If a step is too hard, break it down into smaller steps or go slower.

As you’re resisting your compulsions, focus on the feelings of anxiety. Instead of trying to distract yourself, allow yourself to feel anxious as you resist the urge to engage in your compulsive behavior. You may believe that the discomfort you’re feeling will continue until you engage in the compulsion. But if you stick with it, the anxiety will fade. And you’ll realize that you’re not going to “lose control” or have some kind of breakdown if you don’t perform the ritual.

Practice. The more often you practice, the quicker your progress will be. But don’t rush. Go at a pace that you can manage without feeling overwhelmed. And remember: you will feel uncomfortable and anxious as you face your fears, but the feelings are only temporary. Each time you expose yourself to your trigger, your anxiety should lessen and you’ll start to realize that you have more control (and less to fear) than you thought.

Tip 3: Challenge obsessive thoughts

Everyone has troubling thoughts or worries from time to time. But obsessive-compulsive disorder causes the brain to get stuck on a particular anxiety-provoking thought, causing it to play over and over in your head. The more unpleasant or distressing the thought, the more likely you are to try to repress it. But repressing thoughts is almost impossible and
trying usually has the opposite effect, causing the unpleasant thought to resurface more frequently and become more bothersome.

As with resisting compulsions, you can overcome disturbing, obsessive thoughts by learning to tolerate them through exposure and response prevention exercises. It’s also important to remind yourself that just because you have an unpleasant thought, that doesn’t make you a bad person. Your thoughts are just thoughts. Even unwanted, intrusive, or violent thoughts are normal—it’s only the importance you attach to them that turns them into damaging obsessions.

The following strategies can help you see your thoughts for what they are and regain a sense of control over your anxious mind.

**Write down your obsessive thoughts.** Keep a pad and pencil on you, or type on a smartphone. When you begin to obsess, write down all your thoughts or compulsions.

- Keep writing as the OCD urges continue, aiming to record exactly what you’re thinking, even if you’re repeating the same phrases or the same urges over and over.
- Writing it all down will help you see just how repetitive your obsessions are.
- Writing down the same phrase or urge hundreds of times will help it lose its power.
- Writing thoughts down is much harder work than simply thinking them, so your obsessive thoughts are likely to disappear sooner.

**Create an OCD worry period.** Rather than trying to suppress obsessions or compulsions, develop the habit of rescheduling them.

- Choose one or two 10-minute “worry periods” each day, time you can devote to obsessing.
- During your worry period, focus only on negative thoughts or urges. Don’t try to correct them. At the end of the worry period, take a few calming breaths, let the obsessive thoughts go, and return to your normal activities. The rest of the day, however, is to be designated free of obsessions.
- When thoughts come into your head during the day, write them down and “postpone” them to your worry period.

**Challenge your obsessive thoughts.** Use your worry period to challenge negative or intrusive thoughts by asking yourself:

- What’s the evidence that the thought is true? That it’s not true? Have I confused a
thought with a fact?
• Is there a more positive, realistic way of looking at the situation?
• What’s the probability that what I’m scared of will actually happen? If the probability is low, what are some more likely outcomes?
• Is the thought helpful? How will obsessing about it help me and how will it hurt me?
• What would I say to a friend who had this thought?

Create a tape of your OCD obsessions or intrusive thoughts. Focus on one specific thought or obsession and record it to a tape recorder or smartphone.

• Recount the obsessive phrase, sentence, or story exactly as it comes into your mind.
• Play the tape back to yourself, over and over for a 45-minute period each day, until listening to the obsession no longer causes you to feel highly distressed.
• By continuously confronting your worry or obsession you will gradually become less anxious. You can then repeat the exercise for a different obsession.

**Tip 4: Reach out for support**

OCD can get worse when you feel powerless and alone, so it’s important to build a strong support system. The more connected you are to other people, the less vulnerable you’ll feel. And just talking to an understanding person about your worries and urges can make them seem less threatening.

**Stay connected to family and friends.** Obsessions and compulsions can consume your life to the point of social isolation. In turn, social isolation will aggravate your OCD symptoms. It’s important to invest in relating to family and friends. Talking face-to-face about your worries and urges can make them feel less real and less threatening.

**Join an OCD support group.** You’re not alone in your struggle with OCD, and participating in a support group can be an effective reminder of that. OCD support groups enable you to both share your own experiences and learn from others who are facing the same problems.

**Tip 5: Manage stress**

While stress doesn’t cause OCD, it can trigger symptoms or make them worse. Physical exercise and connecting with another person face-to-face are two very effective ways to calm your nervous system. You can also:
Quickly self-soothe and relieve anxiety symptoms by making use of one or more of your physical senses—sight, smell, hearing, touch, taste—or movement. You might try listening to a favorite piece of music, looking at a treasured photo, savoring a cup of tea, or stroking a pet.

Practice relaxation techniques. Mindful meditation, yoga, deep breathing, and other relaxation techniques can help lower your overall stress and tension levels and help you manage your urges. For best results, try practicing a relaxation technique regularly.

Tip 6: Make lifestyle changes to ease OCD

A healthy, balanced lifestyle plays a big role in easing anxiety and keeping OCD compulsions, fears, and worry at bay.

Exercise regularly. Exercise is a natural and effective anti-anxiety treatment that helps to control OCD symptoms by refocusing your mind when obsessive thoughts and compulsions arise. For maximum benefit, try to get 30 minutes or more of aerobic activity on most days. Ten minutes several times a day can be as effective as one longer period especially if you
pay mindful attention to the movement process.

**Get enough sleep.** Not only can anxiety and worry cause insomnia, but a lack of sleep can also exacerbate anxious thoughts and feelings. When you’re well rested, it’s much easier to keep your emotional balance, a key factor in coping with anxiety disorders such as OCD.

**Avoid alcohol and nicotine.** Alcohol temporarily reduces anxiety and worry, but it actually causes anxiety symptoms as it wears off. Similarly, while it may seem that cigarettes are calming, nicotine is actually a powerful stimulant. Smoking leads to higher, not lower, levels of anxiety and OCD symptoms.

**Treatment for OCD**

Cognitive-behavioral therapy is the most effective treatment for obsessive-compulsive disorder and generally involves two components:

1. **Exposure and response prevention**, which requires repeated exposure to the source of your obsession, as explained above.
2. **Cognitive therapy**, which focuses on the catastrophic thoughts and exaggerated sense of responsibility you feel. A big part of cognitive therapy for OCD is teaching you healthy and effective ways of responding to obsessive thoughts, without resorting to compulsive behavior.

**Other OCD treatments**

In addition to cognitive-behavioral therapy, the following treatments are also used for OCD:

**Medication.** Antidepressants are sometimes used in conjunction with therapy for the treatment of obsessive-compulsive disorder. However, medication alone is rarely effective in relieving the symptoms.

**Family Therapy.** Since OCD often causes problems in family life and social adjustment, family therapy can help promote understanding of the disorder and reduce family conflicts. It can also motivate family members and teach them how to help their loved one with OCD.

**Group Therapy.** Through interaction with fellow OCD sufferers, group therapy provides support and encouragement and decreases feelings of isolation.
Is unresolved trauma playing a role in your OCD?

In some people, OCD symptoms such as compulsive washing or hoarding are ways of coping with trauma. If you have post-traumatic OCD, cognitive approaches may not be effective until underlying traumatic issues are resolved.

How to help someone with OCD

The way you react to your loved one’s OCD symptoms can have a big impact on their outlook and recovery. Negative comments or criticism can make OCD worse, while a calm, supportive environment can help improve the outcome of treatment.

Avoid making personal criticisms. Remember, your loved one’s OCD behaviors are symptoms, not character flaws.

Don’t scold someone with OCD or tell them to stop performing rituals. They can’t comply, and the pressure to stop will only make the behaviors worse.

Be as kind and patient as possible. Each sufferer needs to overcome problems at their own pace. Praise any successful attempt to resist OCD, and focus attention on positive elements in the person’s life.

Do not play along with your loved one’s rituals. Going along with your loved one’s OCD “rules,” or helping with their compulsions or rituals will only reinforce the behavior. Support the person, not their compulsions.

Keep communication positive and clear. Communication is important so you can find a balance between supporting your loved one and standing up to the OCD symptoms and not further distressing your loved one.

Find the humor. Laughing together over the funny side and absurdity of some OCD symptoms can help your loved one become more detached from the disorder. Just make sure your loved one feels respected and in on the joke.

Don’t let OCD take over family life. Sit down as a family and decide how you will work together to tackle your loved one’s symptoms. Try to keep family life as normal as possible and the home a low-stress environment.
Authors: Melinda Smith, M.A., Lawrence Robinson, and Jeanne Segal, Ph.D.

**Will you help keep HelpGuide free for all?**

One in four people will struggle with mental health at some point in their lives. And with the coronavirus pandemic and troubled economy, many are in crisis right now. More than ever, people need a trustworthy place to turn to for guidance and hope. That is our mission at HelpGuide. Our free online resources ensure that everyone can get the help they need when they need it—no matter what health insurance they have, where they live, or what they can afford. But as a nonprofit that doesn’t run ads or accept corporate sponsorships, we need your help. If you have already contributed, thank you. If you haven’t, please consider helping us reach those who need it: [Donate today from as little as $3](#).
