

Senior Exercise and Fitness Tips

No Matter Your Age, It's Never Too Late to Get Started

There are many reasons why we tend to slow down and become more sedentary with age. It may be due to health problems, weight or pain issues, or worries about falling. Or perhaps you think that exercising simply isn't for you. But as you grow older, an active lifestyle becomes more important than ever to your health. Getting moving can help boost your energy, maintain your independence, protect your heart, and manage symptoms of illness or pain as well as your weight. And regular exercise is also good for your mind, mood, and memory. No matter your age or your current physical condition, these tips can show you simple, enjoyable ways to become more active and improve your health and outlook.

What are the benefits of exercise for older adults?

A recent Swedish study found that physical activity was the number one contributor to longevity, adding extra years to your life—even if you don't start exercising until your senior years. But getting active is not just about adding years to your life, it's about adding life to your years. You'll not only look better when you exercise, you'll feel sharper, more energetic, and experience a greater sense of well-being.

Physical health benefits

Helps you maintain or lose weight. As metabolism naturally slows with age, maintaining a healthy weight is a challenge. Exercise helps increase metabolism and builds muscle mass, helping to burn more calories.

Reduces the impact of illness and chronic disease. People who exercise tend to have improved immune and digestive functioning, better blood pressure and bone density, and a lower risk of Alzheimer's disease, diabetes, obesity, heart disease, osteoporosis, and certain cancers.

Enhances mobility, flexibility, and balance. Exercise improves your strength, flexibility and posture, which in turn will help with balance, coordination, and reducing the risk of falls. Strength training also helps alleviate the symptoms of chronic conditions such as arthritis.

Mental health benefits

Improves sleep. Quality sleep is vital for your overall health. Regular activity can help you fall asleep more quickly, sleep more deeply, and wake feeling more energetic and refreshed.

Boosts mood and self-confidence. Exercise is a huge stress reliever and the endorphins produced can actually help reduce feelings of sadness, depression, or anxiety. Being active and feeling strong naturally helps you feel more self-confident.

Does amazing things for the brain. Activities like Sudoku or crossword puzzles can help keep your brain active, but little comes close to the beneficial effects of exercise on the brain. It can help brain functions as diverse as multitasking and creativity and can help prevent memory loss, cognitive decline, and dementia. Getting active may even help slow the progression of brain disorders such as Alzheimer's disease.

Overcoming obstacles to getting active as you age

Starting or maintaining a regular exercise routine can be a challenge at any age—and it doesn't get any easier as you get older. You may feel discouraged by health problems, aches and pains, or concerns about injuries or falls. If you've never exercised before, you may not know where to begin, or perhaps you think you're too old or frail, can never live up to the standards you set when you were younger. Or maybe you just think that exercise is boring.

While these may seem like good reasons to slow down and take it easy as you age, they're even better reasons to get moving. Becoming more active can energize your mood, relieve stress, help you manage symptoms of illness and pain, and improve your overall sense of well-being. And reaping the rewards of exercise doesn't have to involve strenuous workouts or trips to the gym. It's about adding more movement and activity to your life, even in small ways. No matter your age or physical condition, it's never too late to get your body moving, boost your health and outlook, and improve how you age.

Five myths about activity and aging

Myth 1: There's no point to exercising. I'm going to get old anyway.

Fact: Regular physical activity helps you look and feel younger and stay independent longer. It also lowers your risk for a variety of conditions, including Alzheimer's and dementia, heart disease, diabetes, certain cancers, high blood pressure, and obesity. And the mood benefits of exercise can be just as great at 70 or 80 as they were at 20 or 30.

Myth 2: Exercise puts me at risk of falling down.

Fact: Regular exercise, by building strength and stamina, prevents loss of bone mass and improves balance, actually reducing your risk of falling.

Myth 3: It's too frustrating: I'll never be the athlete I once was.

Fact: Changes in hormones, metabolism, bone density, and muscle mass mean that strength and performance levels inevitably decline with age, but that doesn't mean you can no longer derive a sense of achievement from physical activity or improve your health. The key is to set lifestyle goals that are appropriate to your age. And remember: a sedentary lifestyle takes a much greater toll on athletic ability than biological aging.

Myth 4: I'm too old to start exercising.

Fact: You're never too old to get moving and improve your health! In fact, adults who become active later in life often show greater physical and mental improvements than their younger counterparts. If you've never exercised before, or it's been a while, you won't be encumbered by the same sports injuries that many regular exercisers experience in later life. In other words, there aren't as many miles on your clock so you'll quickly start reaping the rewards. Just begin with gentle activities and build up from there.

Five myths about activity and aging

Myth 5: I can't exercise because I'm disabled.

Fact: [Chair-bound people face special challenges](/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm) (/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm) but can lift light weights, stretch, and do chair aerobics, chair yoga, and chair Tai Chi to increase range of motion, improve muscle tone and flexibility, and promote cardiovascular health. Many swimming pools offer access to wheelchair users and there are adaptive exercise programs for wheelchair sports such as basketball.

Myth 6: I'm too weak or have too many aches and pains.

Fact: Getting moving can help you manage pain and improve your strength and self-confidence. Many older people find that regular activity not only helps stem the decline in strength and vitality that comes with age, but actually improves it. The key is to start off gently.

What if you hate to exercise?

If you dread working out, you're not alone. But you don't have to exercise until you're soaked in sweat or every muscle aches to make a big difference to your health. Think about activities that you enjoy and how you can incorporate them into an exercise routine:

- ▶ Listen to music or an audiobook while lifting weights.
- ▶ Window shopping while walking laps at the mall.
- ▶ Get competitive while playing tennis.
- ▶ Take photographs on a nature hike.
- ▶ Meet new people at a yoga class or fitness center.
- ▶ Watch a favorite movie or TV show while on the treadmill.
- ▶ Instead of chatting with a friend over coffee, chat while walking, stretching, or strength training.
- ▶ Walk the golf course instead of using a cart.
- ▶ Walk or play fetch with a dog. If you don't own a dog, offer to take a neighbor's dog for a walk or volunteer at a pet shelter or rescue group.
- ▶ Go for a run, walk, or cycle when you're feeling stressed—see how much better you

- ▶ feel afterwards.
- ▶ Find an exercise buddy, someone whose company you really enjoy, and try activities you've never tried before—you may find something you love. At worst, you've spent time with a good friend.

Building a balanced exercise plan

Staying active is not a science. Just remember that mixing different types of physical activity helps both to keep your workouts interesting and improve your overall health. The key is to find activities that you enjoy—based on the four building blocks of fitness. These are:

1: Balance

What it is: Maintains standing and stability, whether you're stationary or moving around. Try yoga, Tai Chi, and posture exercises to gain confidence with balance.

Why it's good for you: Improves balance, posture, and quality of your walking. Also reduces risk of falling and fear of falls.

2: Cardio

What it is: Uses large muscle groups in rhythmic motions over a period of time. Cardio workouts get your heart pumping and you may even feel a little short of breath. Includes walking, stair climbing, swimming, hiking, cycling, rowing, tennis, and dancing.

Why it's good for you: Helps lessen fatigue and shortness of breath. Promotes independence by improving endurance for daily activities such as walking, house cleaning, and errands.

3: Strength and power training

What it is: Builds up muscle with repetitive motion using weight or external resistance from body weight, machines, free weights, or elastic bands. Power training is often strength training done at a faster speed to increase power and reaction times.

Why it's good for you: Strength training helps prevent loss of bone mass, builds muscle, and improves balance—both important in staying active and avoiding falls. Power training can improve your speed while crossing the street, for example, or prevent falls by enabling you to react quickly if you start to trip or lose balance. Building strength and power will help you stay independent and make day-to-day activities easier such as opening a jar, getting in and out of a car, and lifting objects.

4: Flexibility

What it is: Challenges the ability of your body's joints to move freely through a full range of motion. This can be done through stationary stretches and stretches that involve movement to keep your muscles and joints supple and less prone to injury. Yoga is an excellent means of improving flexibility.

(/harvard/whats-the-best-exercise-plan-for-me.htm)

[What's the Best Exercise Plan for Me?](/harvard/whats-the-best-exercise-plan-for-me.htm) (/harvard/whats-the-best-exercise-plan-for-me.htm)

Why it's good for you: Helps your body stay limber and increases your range of movement for ordinary physical activities such as looking behind while driving, tying your shoes, shampooing your hair, and playing with your grandchildren.

Types of activities beneficial to older adults

Walking. Walking is a perfect way to start exercising. It requires no special equipment, aside from a pair of comfortable walking shoes, and can be done anywhere.

Senior sports or fitness classes. Keeps you motivated while also providing a source of fun, stress relief, and a place to meet friends.

Water aerobics and water sports. Working out in water reduces stress and strain on the body's joints.

Yoga. Combines a series of poses with breathing. Moving through the poses works on strength, flexibility and balance, and can be adapted to any level.

Tai Chi and Qi Gong. Martial arts-inspired systems of movement that increase balance and strength. Classes for seniors are often available at local YMCA or community centers.

Getting started safely

Getting active is one of the healthiest decisions you can make as you age, but it's important to do it safely.

Get medical clearance from your doctor before starting an exercise program, especially if you have a preexisting condition. Ask if there are any activities you should avoid.

Consider health concerns. Keep in mind how your ongoing health problems affect your workouts. For example, diabetics may need to adjust the timing of medication and meal plans when setting an exercise schedule.

Listen to your body. Exercise should never hurt or make you feel lousy. Stop exercising immediately and call your doctor if you feel dizzy or short of breath, develop chest pain or pressure, break out in a cold sweat, or experience pain. And put your routine on hold if a joint is red, swollen, or tender to the touch—the best way to cope with injuries is to avoid them in the first place. If you regularly experience pain or discomfort after exercising, try exercising for less time but more frequently throughout the day.

Start slow and build up steadily. If you haven't been active in a while, build up your exercise program little by little. Try spacing workouts in ten-minute increments twice a day. Or try just one class each week. If you're concerned about falling or have an ongoing heart problem, start with easy chair exercises to slowly increase your fitness and confidence.

Prevent injury and discomfort by [warming up](#), [cooling down](#) (/articles/healthy-living/how-to-start-exercising-and-stick-to-it.htm), and keeping water handy.

Commit to an exercise schedule for at least 3 or 4 weeks so that it becomes habit, and force yourself to stick with it. This is much easier if you find activities you enjoy.

Experiment with mindfulness. Instead of zoning out when you exercise, try to focus on how your body feels as you move—the rhythm of your breathing, the way your feet strike the ground, your muscles flexing, for example. You'll improve your physical condition faster, better help to relieve stress and anxiety, and more likely to avoid accidents or injuries.

If you have an injury, disability, weight problem, or diabetes...

[How to Exercise if You Have Limited Mobility](/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm) (/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm)

While there are challenges that come with [exercising with mobility issues](/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm) (/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm), by adopting a creative approach, you can overcome any physical limitations and find enjoyable ways to get active and improve your health and well-being.

Support activity levels with the right diet

Diet as well as exercise can have a major impact on energy, mood, and fitness. Many older adults don't get sufficient high-quality protein in their diets despite evidence suggesting they actually need more than younger people to maintain energy levels and lean muscle mass, promote recovery from illness and injury, and support overall health. Older adults without kidney disease or diabetes should aim for about 0.5 grams of protein per pound of body weight.

- Vary your sources of protein instead of relying on just red meat, including more fish, poultry, beans, and eggs.
- Reduce the amount of processed carbohydrates you consume—pastries, cakes, pizza, cookies and chips—and replace them with high-quality protein.
- Snack on nuts and seeds instead of chips, replace a baked dessert with Greek yogurt, swap out slices of pizza for a grilled chicken breast and a side of beans.

Tips for staying motivated

It's easy to become discouraged when illness, injury, or changes in the weather interrupt your routine and seem to set you back to square one. But there are ways to stay motivated when life's challenges get in the way:

Focus on short-term goals, such as improving your mood and energy levels and reducing stress, rather than goals such as weight loss, which can take longer to achieve.

Reward yourself when you successfully complete a workout, reach a new fitness goal, or simply show up on a day when you were tempted to ditch your activity plans. Choose something you look forward to, but don't allow yourself to do until after exercising, such as having a hot bath or a favorite cup of coffee.

Keep a log. Writing down your activities in an exercise journal not only holds you accountable, but is also a reminder of your accomplishments.

Get support. When you work out with a friend or family member, you can encourage and motivate each other.

How to stay fit when your routine changes

You're on vacation

- Many hotels now have fitness centers. Bring along your exercise clothing or equipment (resistance band, bathing suit, or walking shoes).
- Get out and see the sights on foot rather than just by tour bus.

Caring for an ill spouse is taking up too much of your time

- Work out to an exercise video when your spouse is napping
- Ask a family member or friend to come over so you can go for a walk

Your usual exercise buddy moves away

- Ask another friend to go with you on your daily walk.
- Reach out to other older adults in your area—many are in the same boat as you so be the one to break the ice.
- Join an exercise class at your local community center or senior center. This is a great way to meet other active people.

How to stay fit when your routine changes

You move to a new community

- Check out the fitness centers, parks, community websites, and recreation associations in your new neighborhood.
- Look for activities that match your interests and abilities.

Illness keeps you out of action for a few weeks

- Wait until you feel better and then start your activity again.
- Gradually build back up to your previous level of activity.

You're recovering from injury or surgery

- Talk with your doctor about specific exercises and activities you can do safely.
- Start slowly and gradually build up your activities as you become stronger.
